EXPERIENCE

Senior Backend Engineer, Meridian Retail Systems | Pittsburgh, PA | March 2024 – Present

Built and deployed an LLM-powered product recommendation agent serving 2.8M monthly shoppers across Meridian's client network of mid-market retailers. The system integrates with Shopify, WooCommerce, and custom storefronts via REST APIs, processing real-time inventory and customer behavior signals to generate personalized suggestions. Engineered the agentic layer using Claude API with function calling to handle dynamic product queries, pricing lookups, and promotional logic. Implemented comprehensive observability across API latency, token usage, and recommendation accuracy; achieved 94% uptime and reduced average response time to 320ms through AWS Lambda optimization. Collaborated with product and merchant success teams to shape feature rollouts based on direct retailer feedback.

Platform Engineer, Velocity Data Labs | Cleveland, OH | July 2021 – February 2024

Owned core data pipeline infrastructure processing 40TB+ daily event streams for e-commerce analytics clients. Designed and maintained Kafka clusters, Postgres databases, and Spark jobs that powered real-time dashboards and offline reporting for enterprise customers. Mentored junior engineers on cloud deployment patterns and debugged complex infrastructure issues in production. Extended the platform's Python SDK to simplify API consumption; this work directly reduced onboarding time for new clients by 35%.

Backend Engineer, Cascade Digital | Detroit, MI | September 2019 – June 2021

Developed inventory management and order fulfillment APIs serving internal warehouse operations and third-party seller integrations. Shipped critical features including batch processing for price synchronization across channels and webhook-based event notifications. Worked across operations and finance teams to validate requirements and resolve production incidents.
