

Delphine Aubert

AI Engineer | Agent Systems & Production ML

delphine.aubert@mailbox.com | (206) 447-2893 | Seattle, WA

NEXUS ENTERTAINMENT — SENIOR AI ENGINEER

March 2023 – Present

Built and shipped an autonomous content recommendation agent serving Nexus's streaming platform to 2.8M monthly active users. The system uses tool-calling to fetch user viewing history, genre metadata, and trending content signals, then orchestrates multi-step reasoning to generate personalized watch lists. Implemented agentic memory that persists user preferences across sessions, reducing recommendation staleness by 34%. On-call for the service; managed three production incidents last quarter including a model latency spike that I traced to a downstream API regression and resolved through caching strategy changes. Regularly present quarterly metrics and roadmap decisions to non-technical stakeholders including the Head of Product and the executive team.

BEACON MEDIA GROUP — ML ENGINEER

July 2022 – February 2023

Developed a live caption generation agent for Beacon's broadcast workflow that integrates with their existing playout infrastructure via REST APIs. The agent fetches audio streams, calls OpenAI Whisper for transcription, then chains tool calls to a custom fact-checking service and downstream caption formatting system. Deployed to production supporting 40+ live events monthly with 99.2% uptime. Owned incident response and monitoring dashboards; iterated on memory buffering strategies to reduce hallucination in fast-spoken content. Collaborated directly with broadcast operators and editors to refine latency targets and error handling behavior based on their real production constraints.

PRISM ANALYTICS — AI ENGINEER

January 2022 – June 2022

Prototyped and launched an anomaly detection agent that monitored client infrastructure logs. Created tool set for querying time-series databases and alerting systems; agent memory tracked anomaly patterns to reduce false positives over time.
